

ABSTRACT

An etchant and an etching method that contribute to prevention of metal contamination of a semiconductor silicon wafer, and a semiconductor silicon wafer in which metal contamination is extremely reduced, are provided. The etchant according to the present invention is prepared by immersing stainless steel in an alkali aqueous solution for not less than 10 hours. In the etching method according to the present invention, a semiconductor silicon wafer is etched by using the etchant. Thereby, the semiconductor silicon wafer according to the present invention, in which metal contamination is extremely reduced, is obtained.
